

ABSTRACT

A film scanning device has a same CCD light sensor for pictures of strip film and slide mount. The film scanning device includes a first opening for insertion of a strip film, a second opening that is an exit for film that is carried from the first opening to the exit, a third opening for insertion of a slide mount in a direction perpendicular to the direction the strip film moves. The first and the second openings are located at two sides of a main body of the device, the third opening is located at a front part of the body and is juxtaposed vertically relative to a path between the first and second openings.
